there is too much iron in the soil

SIGNIFICANCE OF ISSUE

In the Netherlands exists the geographical condition that the soil is getting closer to the sea level towards the sea. The same happens with the groundwater level and as a result a water flow evolves. Due to the fact that the area has an outstanding amount of iron in the soil, the water is spiked with iron on the way to the sea. As soon as the farmers want to use the water from the well, they have to filter out the iron. Otherwise the pipes will get blocked with iron.
